RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 40 pages. Original publisher: Washington, D. C. : National Aeronautics and Space Administration, Office of Management, Scientific and Technical Information Division ; Springfield, Va. : For sale by the National Technical Information Service, 1989. OCLC Number: (OCoLC)34352513 Subject: Aerodynamic load -- Measurement. Excerpt: . . . subsonic boundary layers. He found that a recession indicating that Reynolds number was not an important depth of 5 percent of the sensor diameter can result in a variable. On the other hand, the Raman data, a 75-percent increase in the total RMS pressure relationships were taken at nominally the same Mach number relative to that for a flush-mounted sensor. Hanly member in a different facility but with a similar experienced changes in spectrum levels for supersonic free-jet setup, produced significantly different spectra stream Mach numbers. His results show nonuniform for Reynolds numbers ranging 2.2 to 4.6 times lower spectrum level as a function of reduced changes in than those for the present tests. frequency for a given recession. The spectrum level Time Histories variations about a reference spectrum for the flush-mounted condition were 50 percent and 60 percent. Figure 14 shows a comparison of the uncorrected cent for recession values of 0.0004528 and 0.01138, and corrected time histories for a 4-msec segment 1. Moo respectively, at 7. Similar measurements at of the high Reynolds number run. The top trace is 2.5 indicated a somewhat smaller variation Moo the uncorrected time history, which shows the strong (-50 percent to 25 percent) about the reference periodic nature of the sensor signal resulting from spectrum for the same recessions. the sensor resonance. The bottom trace is the true time history with the effects of the sensor resonance is clear from the works of Gaudet...
